Anatomy And Physiology Skeletal System

Anatomy of the Skeletal System The skeleton is subdivided into two divisions: the axial skeleton, the bones that form the longitudinal axis of the body, and the appendicular skeleton, the bones of the limbs and girdles.

Skeletal System Anatomy and Physiology - Nurseslabs

The skeletal system includes all of the bones, cartilages, and ligaments of the body that support and give shape to the body and body structures. The skeleton consists of the bones of the body. For adults, there are 206 bones in the skeleton. Younger individuals have higher numbers of bones because some bones fuse together during childhood and adolescence to form an adult bone.

The human skeleton contains 206 known bones and because of its sheer scope, a classification system had to be invented. Typically, bones are classified into four categories by shape: long, short, flat, and irregular. The skeleton is again classified into smaller and more specific groups which we'll discuss in future publications.

The skeletal system is the body system composed of bones, cartilages, ligaments and other tissues that perform essential functions for the human body. Bone tissue, or osseous tissue, is a hard, dense connective tissue that forms most of the adult skeleton, the internal support structure of the body.

Bone, or osseous tissue, is a hard, dense connective tissue that forms most of the adult skeleton, the support structure of the body. In the areas of the skeleton where bones move (for example, the ribcage and joints), cartilage, a semi-rigid form of connective tissue, provides flexibility and smooth surfaces for movement.

Indeed humans are fortunate to have the entire skeletal system because it fulfills many important functions in the body. The skeletal system protects the soft tissues and vital organs; enables easier locomotion and serves as a framework as it shapes and supports the entire body.

Skeletal System - Anatomy And Physiology

Without the skeletal system to support our bodies, we would have no rigid framework to support the soft tissues of the body and no systems of levers so critical for movement. The skeletal system consists of bones and their associated connective tissues, including cartilage, tendons and ligaments. Can We Write Your Essay?
