Attachment From Infancy To Adulthood

Attachment theory has come to the forefront, providing an understanding of how people get to be as they are - a belief that the first years of a child's life and the security of their attachment to their significant caretaker figures determine their future mental health.

understanding the role of early attachment in adult life and the degree of stability that should be expected from infancy to adulthood, it is of theoretical importance to determine which developmental process best characterizes stability and change in attachment.

Attachment Stability From Infancy to Adulthood: Meta ...

Attachment Parenting (AP) is not a new occurrence. In fact, Mary Slater Ainsworth [1], a developmental psychologist best known for her work in attachment theory, worked with John Bowlby [2] (the founder of attachment theory) at Tavistock Clinic in England, researching mother/infant attachments and studying what effects, if any, resulted from the parent and child connection.

What Is Attachment Parenting and Does It Work?

Kids with preoccupied attachment learn to be hypervigilant around their parents,

argued that early experiences accumulate in a manner that contributes to the child's developing social skills and competence—skills that have the potential to shape later peer relationships and one's developing attachment style (e.g., Bartholomew & Horowitz, 1991; Englund et al., 2011).

Interpersonal and Genetic Origins of Adult Attachment ...

For the analysis of early influences on the representation of close relationships, data on child attachment and exploratory strategies, maternal and paternal sensitivity and support were aggregated for the periods of infancy (birth to age three), childhood (five to 10) and adolescence (16 to 18). 11 In addition, we conducted various studies in other cultures, 24 adding to the long tradition of cross-cultural research on attachment. 25

Attachment from Infancy to Adulthood: The Major ...

Following children from infancy to 19 years of age, attachment during infancy was found to be a significant predictor of attachment security during adolescence. In contrast to these findings, a sample of 57 high risk young adults showed no significant continuity of attachment style between infancy and adulthood.
